

Worksheet: Barrier Prioritisation

Instructions:**Step 1:**

You will now prioritise your barriers using the following criteria:

- **Impact:** Which barriers, if overcome, would increase immunization the most? Which can impact the most number of people? Which targets the majority of caregivers within your priority community?
- **Complexity:** Which barriers are the hardest ones to solve? Which are the easiest to solve for? Which barriers are more complex to navigate?

Step 2:

In your groups, go through each barrier and place it in the relevant box. If you used post-its, move these post-its from the Barrier worksheet to this worksheet. Otherwise, write the barriers again in this worksheet. For example, imagine your group identified this barrier: "Most mothers forget to return for a second round of immunization."

- If most caregivers do this, this would be a "high impact" barrier as it affects a lot of people.
- It is a relatively easy barrier to solve as the problem is known, and simple solutions exist to solve it. Therefore, it would be "low complexity."
- This barrier would be placed in the top right box.

Step 3:

Review the barriers in the top left and right boxes, and select the top three to five you think are the highest priority to solve for in your priority communities.

Priority Community Name:

BARRIER PRIORITISATION:

HIGH IMPACT

(If solved, many more caregivers would vaccinate)

HIGH COMPLEXITY

(Complicated solutions can solve this barrier)

LOW COMPLEXITY

(Simple solutions can solve this barrier)

LOW IMPACT

(If solved, only a few more caregivers would vaccinate)
