Worksheet:
Re-prioritise Barriers

Instructions

Step 1:
Review your prioritised barriers from Workshop 1, and any new barriers you learned during interviews.

Step 2:
Re-prioritise all of your group's barriers using the following criteria:
- **Impact:** Which barriers, if overcome, would increase immunization the most? Which can impact the most number of people in your priority community?
- **Complexity:** Which barriers are the hardest ones to solve? Which are the easiest to solve for?

Step 3:
Place each barrier in the relevant box. For example, imagine your group identified this barrier: "Most mothers forget to return for a second round of immunization."
- If most caregivers do this, this would be a "high impact" barrier as it affects a lot of people.
- It is a relatively easy barrier to solve as the problem is known, and simple solutions exist to solve it. Therefore, it would be "low complexity."
- This barrier would be placed in the top right box.

Step 4:
Review the barriers in the top left and right boxes, and select the top three to five you think are the highest priority to solve for in your priority communities. These may be the same as in Workshop 1, or slightly changed based on your field interviews.

Priority Community Name: . . . .

BARRIER PRIORITISATION:

HIGH IMPACT
(If solved, many more caregivers would vaccinate)

10

HIGH COMPLEXITY (Complicated solutions can solve this barrier)   (Simple solutions can solve this barrier) **LOW COMPLEXITY**

10   5   0

0

LOW IMPACT
(If solved, only a few more caregivers would vaccinate)
